Bar Code Scanners in Lottery Kiosks

MICROSCAN®

Lottery kiosks – bar codes printed on lottery tickets

A manufacturer wanted to automate lottery kiosks by embedding a bar code reader inside.

Automation would provide the customer with immediate feedback on whether they held the winning ticket. At the same time, it would save the establishment where the kiosk was located staff time because the clerk would no longer be needed to check tickets.

MICROSCAN®

The installation

The bar code reader was integrated into the kiosk above the opening where the tickets are inserted.

The short distance between the reader and the bar code on the ticket required a reader with a wide scan width.

In addition to a wide scan width, the MS-3 also provided a small footprint. This feature combination enabled the reader to be integrated very close to the opening, yet still provide a beak wide enough to cover the entire opening below.

MICROSCAN®

Why the MS-3 Laser Scanner

The MS-3 was selected because it offered the following features:

- Wide scan width
- Small package size
- Excellent price/performance

MICROSCAN[®]

The bottom line

The MS-3 provided the manufacturer with the robust performance necessary to read the poor quality bar codes quickly and accurately.

As a result, the scanner produced high customer satisfaction and contributed to the success of the kiosks. Customers were able to have their tickets decoded immediately, and store clerks no longer had to spend their time checking lottery tickets.
